

Oleeva™ Foam

for scars

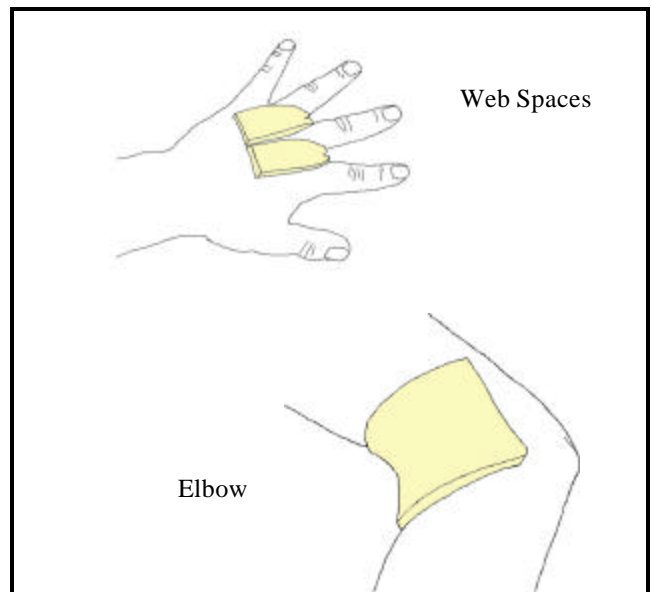

Oleeva™ Foam is used topically for the reduction and prevention of hypertrophic scars and keloids.

Oleeva Foam combines an adhesive silicone surface with a soft and pliable foam material. Oleeva Foam works well under splints or pressure garments to provide padding and improve pressure distribution.

Made with Silon® technology, Oleeva Foam is durable and will not breakdown quickly like ordinary silicone gel.

Easily contouring to complex shapes, Oleeva Foam is ideal for placement over concave or convex areas. Use Oleeva Foam on the flexor surfaces of joints. Oleeva Foam is ideal for the web spaces of the hand, the axilla region or other hard to treat areas.

-  Self-Adhesive
-  Combines Silicone with Foam Padding
-  Maximizes Patient Comfort
-  Durable & Washable
